

Next.js Take-Home Assessment

Software Engineer, Full Stack & Automation - BHF

Objective

Build a small Next.js application that demonstrates server-side rendering, a server action, and dynamic routing. Pick your own data and presentation - we're more interested in how you think than in checking boxes.

Instructions

1. Project setup: initialize a Next.js (App Router, v15) project with TypeScript and Tailwind CSS. It should run without errors.
2. A page with dynamic data: build a page that lists items from a data set of your choosing (a public mock API, a small JSON file you write yourself, anything reasonable), rendered on the server.
3. Server action: implement one server action that changes something meaningful - a like counter, a status toggle, a vote, similar.
4. Dynamic route: add a route that shows a detail view for a single item selected from the list.
5. README: how to run it, what the server action and dynamic route do, and any assumptions you made.

Deliverables

- A working app in a public GitHub repository.
- A README with setup instructions.
- If you used an AI coding assistant (Claude Code, Cursor, Copilot, Codex, Windsurf, or similar): whatever instruction or context file it uses (CLAUDE.md, AGENTS.md, .cursorrules, or equivalent), committed to the repo as-is. If your tool doesn't use a file like that, say so in the README and describe roughly how you directed it.

Evaluation criteria

- Correct project setup (TypeScript, Tailwind, App Router).
- Data fetching and rendering.
- Working server action.
- Working dynamic route.
- Code organization and clarity.
- Bonus: UI polish and creativity.

Notes

- Aim for 2-3 focused hours. You have 2 days from receipt to submit; use that time however works for you.
- Use whatever tools you like, including AI assistants. We care about the result and about your being able to explain and extend it live afterward.
- If something is ambiguous, state your assumption in the README rather than guessing silently.
- Note the approximate time you spent in the README.
